Not illustrated. 1892 Excerpt: .but chiefly on the character of the element combining with them With H and most metals they act only as dyads, but generally exhibit a higher valence in combination with oxygen and the more negative elements. The negative character of the members of this family decreases with the increasing atomic weights, while there is an increase of those physical properties which characterize the metals. Oxygen is a gas, while the other three are solids at ordinary temperatures. (Harris, 83., Stoddard, p. 19, Remsen, pp. 180--182., Cooley, p. 112.) 7. SULPHUR, Sym., S. A.t. Wt., 32. Valence, 2, 4, 6. This element, when acting in its lowest degree of valence, shows much similarity to oxygen, being strongly negative, and forms with all the more positive elements compounds analogous to the corresponding compounds of O. The sulphur molecule varies in the number of atoms it contains with the temperature, being S₈ at 1000°, S₆ at 500°, and at lower temperatures some greater number, probably variable and as yet undetermined. (Harris, 84.) 114 Occurrence. It is widely distributed in nature in both the free and combined states. 1. It is found free in volcanic districts mixed with marl and gypsum rock; principally in Sicily, Italy, and Spain and in considerable quantity in California. 2. It occurs in great abundance and widely distributed as sulphides of the metals and of hydrogen 3. It is found united with oxygen as SO₂, and in the abundant rock known as gypsum, --CaSO₄...
