Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1899 edition. Excerpt: .to that of the charging E.M.F., and in charging the E.M.F. must be higher than the maximum E.M.F., which is obtained between the charged plates when it is being used as a secondary cell. Otherwise electrolysis would cease when the back E.M.F. was equal to the charging E.M.F., and the secondary cell would not be fully charged. Plante constructed a secondary cell, consisting of two sheets of lead, insulated one from another by a layer of flannel and horsehair, and immersed in a vessel of sulphuric acid. In order to have as large an area as possible on which to deposit the gases, he made the lead sheets very large, and rolled them up together with the flannel between them. The lead plates in their ordinary condition, however, will not retain the gases upon their surfaces, and it was found necessary firstly to prepare or form them. This was done by passing the charging current first in one direction, then discharging the secondary cell, and passing the current in the opposite direction, repeating this process until the plates became coated with higher or lower oxides of lead. Then the current is passed in one direction until the gas-bubbles begin to rise to the surface of the liquid. The cell is then charged, and the plates are properly formed, the anode being covered with peroxide of lead, and the kathode plate with a lower oxide, which is reduced to metallic lead in a spongy condition. The...
